## LECTURE 12

1. For the molecules or molecular ions in the problem above, give the formula type (Example: $\mathrm{AX}_{2} \mathrm{E}$ ), the steric number (SN), indicate the geometry (Example: bent), and give expected bond angles.

| Compound | Formula Type | SN | Geometry | Bond angle(s) |
| :--- | :---: | :---: | :---: | :---: |
| (a) $\mathrm{AlCl}_{4}^{-1}$ | $\mathrm{AX}_{4}$ | 4 | Tetrahedral | $109.5^{\circ}$ |
| (b) $\mathrm{XeF}_{3}^{+1}$ | $\mathrm{AX}_{3} \mathrm{E}_{2}$ | 5 | T-Shaped | $<90^{\circ}$ |
| (c) $\mathrm{PCl}_{6}{ }^{-1}$ | $\mathrm{AX}_{6}$ | 6 | Octahedral | $90^{\circ}$ |
| (d) $\mathrm{IF}_{5}$ | $\mathrm{AX}_{5} \mathrm{E}$ | 6 | Square Pyramidal | $<90^{\circ}$ |

2. For each of the following molecules, write the Lewis structure and predict whether each molecule is polar or nonpolar:
(a) $\mathrm{NH}_{3}$
(b) $\mathrm{BF}_{3}$
(c) $\mathrm{OF}_{2}$
(d) $\mathrm{IF}_{3}$

Note that you do not need to indicate formal charges (FC) on your Lewis structures, but you should consider FC to draw most stable Lewis structures.

| a) $\mathrm{NH}_{3}$ is polar | b) $\mathrm{BF}_{3}$ is nonpolar | c) $\mathrm{OF}_{2}$ is polar | d) $\mathrm{IF}_{3}$ is polar |
| :---: | :---: | :---: | :---: |
