### 6.003 Homework \#7

This homework assignment will not be collected. Solutions will be posted.

## Problems

## 1. Second-order systems

The impulse response of a second-order CT system has the form

$$
h(t)=e^{-\sigma t} \cos \left(\omega_{d} t+\phi\right) u(t)
$$

where the parameters $\sigma, \omega_{d}$, and $\phi$ are related to the parameters of the characteristic polynomial for the system: $s^{2}+B s+C$.
a. Determine expressions for $\sigma$ and $\omega_{d}($ not $\phi)$ in terms of $B$ and $C$.
b. Determine

- the time required for the envelope $e^{-\sigma t}$ of $h(t)$ to diminish by a factor of $e$,
- the period of the oscillations in $h(t)$, and
- the number of periods of oscillation before $h(t)$ diminishes by a factor of $e$. Express your results as functions of $B$ and $C$ only.
c. Estimate the parameters in part b for a CT system with the following poles:

The unit-sample response of a second-order DT system has the form

$$
h[n]=r_{0}^{n} \cos \left(\Omega_{0} n+\Phi\right) u[n]
$$

where the parameters $r_{0}, \Omega_{0}$, and $\Phi$ are related to the parameters of the characteristic polynomial for the system: $z^{2}+D z+E$.
d. Determine expressions for $r_{0}$ and $\Omega_{0}($ not $\Phi)$ in terms of $D$ and $E$.
e. Determine

- the length of time required for the envelope $r_{0}^{n}$ of $h[n]$ to diminish by a factor of $e$.
- the period of the oscillations (i.e., $\frac{2 \pi}{\Omega_{0}}$ ) in $h[n]$, and
- the number of periods of oscillation in $h[n]$ before it diminishes by a factor of $e$.

Express your results as functions of $D$ and $E$ only.
f. Estimate the parameters in part e for a DT system with the following poles:

## 2. Matches

The following plots show pole-zero diagrams, impulse responses, Bode magnitude plots, and Bode angle plots for six causal CT LTI systems. Determine which corresponds to which and fill in the following table.

|  | $h(t)$ | Magnitude |
| :--- | :--- | :--- |
| PZ diagram 1: |  | Angle |
| PZ diagram 2: |  |  |
| PZ diagram 3: |  |  |
| PZ diagram 4: |  |  |
| PZ diagram 5: |  |  |
| PZ diagram 6: |  |  |

Impulse response 1

Impulse response 4

## Engineering Design Problems

## 3. Desired oscillations

The following feedback circuit was the basis of Hewlett and Packard's founding patent.

a. With $R=1 \mathrm{k} \Omega$ and $C=1 \mu \mathrm{~F}$, sketch the pole locations as the gain $K$ varies from 0 to $\infty$, showing the scale for the real and imaginary axes. Find the $K$ for which the system is barely stable and label your sketch with that information. What is the system's oscillation period for this $K$ ?
b. How do your results change if $R$ is increased to $10 \mathrm{k} \Omega$ ?

## 4. Robotic steering

Design a steering controller for a car that is moving forward with constant velocity $V$.

You can control the steering-wheel angle $w(t)$, which causes the angle $\theta(t)$ of the car to change according to

$$
\frac{d \theta(t)}{d t}=\frac{V}{d} w(t)
$$

where $d$ is a constant with dimensions of length. As the car moves, the transverse position $p(t)$ of the car changes according to

$$
\frac{d p(t)}{d t}=V \sin (\theta(t)) \approx V \theta(t)
$$

Consider three control schemes:
a. $w(t)=K e(t)$
b. $w(t)=K_{v} \dot{e}(t)$
c. $w(t)=K e(t)+K_{v} \dot{e}(t)$
where $e(t)$ represents the difference between the desired transverse position $x(t)=0$ and the current transverse position $p(t)$. Describe the behaviors that result for each control scheme when the car starts with a non-zero angle $\left(\theta(0)=\theta_{0}\right.$ and $\left.p(0)=0\right)$. Determine the most acceptable value(s) of $K$ and/or $K_{v}$ for each control scheme or explain why none are acceptable.
