# Massachusetts Institute of Technology Department of Electrical Engineering and Computer Science 

1. For the basic block:

$$
\begin{aligned}
\mathrm{q} & =3 \\
\mathrm{r} & =10 \\
\mathrm{~s} & =\mathrm{q}+\mathrm{r} \\
\mathrm{t} & =2 * \mathrm{r}+\mathrm{s} \\
\mathrm{t} & =\mathrm{q} \\
\mathrm{u} & =\mathrm{q}+\mathrm{r} \\
\mathrm{v} & =\mathrm{q}+\mathrm{t} \\
\mathrm{w} & =3+\mathrm{x}
\end{aligned}
$$

State for each of the basic blocks on the following page which optimization was performed on the above:

- Constant Propagation/Folding
- Copy Propagation
- Common Subexpression Elimination
- Dead Code Elimination.
(a) $\mathrm{q}=3$
$r=10$
$\mathrm{s}=\mathrm{q}+\mathrm{r}$
$\mathrm{t} 1=\mathrm{s}$
$\mathrm{t}=2 * \mathrm{r}+\mathrm{s}$
$\mathrm{t}=\mathrm{q}$
$\mathrm{u}=\mathrm{t} 1$
$\mathrm{v}=\mathrm{q}+\mathrm{t}$
$\mathrm{w}=3+\mathrm{x}$
(b) $q=3$
$\mathrm{r}=10$
$\mathrm{s}=\mathrm{q}+\mathrm{r}$
$\mathrm{t}=2 * \mathrm{r}+\mathrm{s}$
$\mathrm{t}=\mathrm{q}$
$u=q+r$
$\mathrm{v}=\mathrm{q}+\mathrm{q}$
$\mathrm{w}=3+\mathrm{x}$
(c) $q=3$
$\mathrm{r}=10$
$\mathrm{s}=13$
$t=33$
$t=3$
$\mathrm{u}=13$
v $=36$
w $=3+x$
(d) $\mathrm{q}=3$
$r=10$
$s=q+r$
$\mathrm{t}=\mathrm{q}$
$u=q+r$
$\mathrm{v}=\mathrm{q}+\mathrm{t}$
w $=3+x$

2. In class we discussed available expression dataflow analysis. Recall that an expression $e$ is available at point $p$ if:

- Every path from the initial node to $p$ evaluates $e$ before reaching p , and
- There are no assignments to any operand of $e$ after evaluation but before $p$.

In the table below, fill in the final values of $\mathbf{I N}$ obtained after performing available expression analysis on the CFG of Figure 1 (next page). A '1' should indicate the expression is available on entry to the block.

|  | $\mathrm{a}+\mathrm{b}$ | $\mathrm{c} * \mathrm{~d}$ | $\mathrm{e} / \mathrm{f}$ |
| :---: | :---: | :---: | :---: |
| B1 | 0 | 0 | 0 |
| B2 |  |  |  |
| B3 |  |  |  |
| B4 |  |  |  |
| B5 |  |  |  |
| B6 |  |  |  |
| B7 |  |  |  |

Figure 1: CFG for problem 2.
3. Recall from lecture that a variable $v$ is live at point $p$ if:

- $v$ is used along some path starting at $p$, and
- There is no definition of $v$ along $p$ before its use.

In the table below, fill in the final values of OUT obtained after performing liveness analysis on the CFG of Figure 2 (next page). A '1' should indicate the variable is live on exit from the block. Assume all variables are visible outside the procedure.

|  | a | b | c |
| :---: | :---: | :---: | :---: |
| B1 |  |  |  |
| B2 |  |  |  |
| B3 |  |  |  |
| B4 |  |  |  |
| B5 |  |  |  |
| B6 |  |  |  |
| B7 | 1 | 1 | 1 |

Figure 2: CFG for problem 3.
4. A compiler hacker writes an analysis to compute values of integer variables in a program. The hacker's analysis maintains a set for each variable at each program point, the set contains the possible values for that variable. The hacker uses set union to combine values at the control-flow join points.
The hacker tests the analysis on several acyclic control flow graphs and it is shipped in the compiler. One of the customers tries to compile a program that contains a loop, and the analysis fails to terminate. What is the problem?

Describe the changes that the compiler hacker must make to fix the analysis.
