MR physics and safety for fMRI

Lawrence L. Wald, Ph.D.

Massachusetts General Hospital
Athinoula A. Martinos Center

Fast MR Imaging Techniques

- **Why, introduction**
- **How: Review of k-space trajectories**
Different techniques (EPI, Spiral)
- **Problems from B0 Susceptibility artifacts**

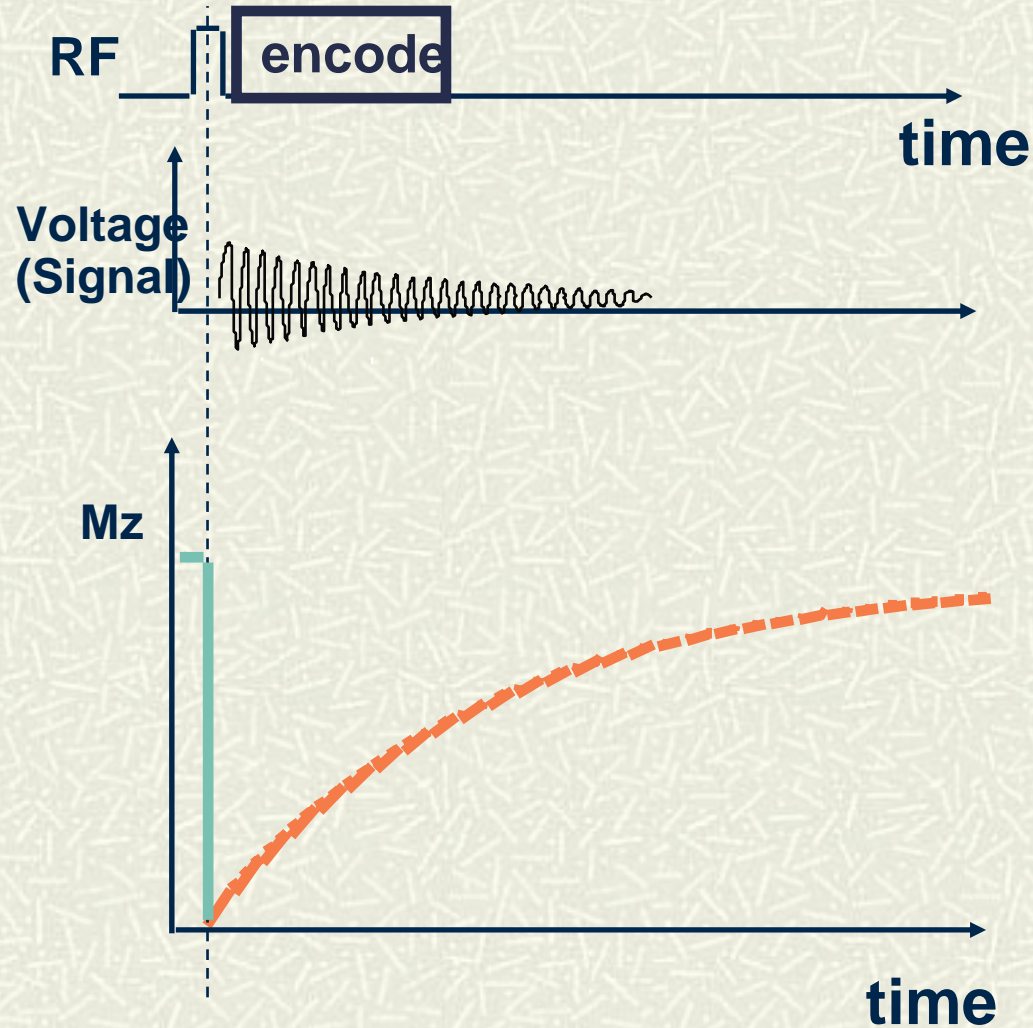

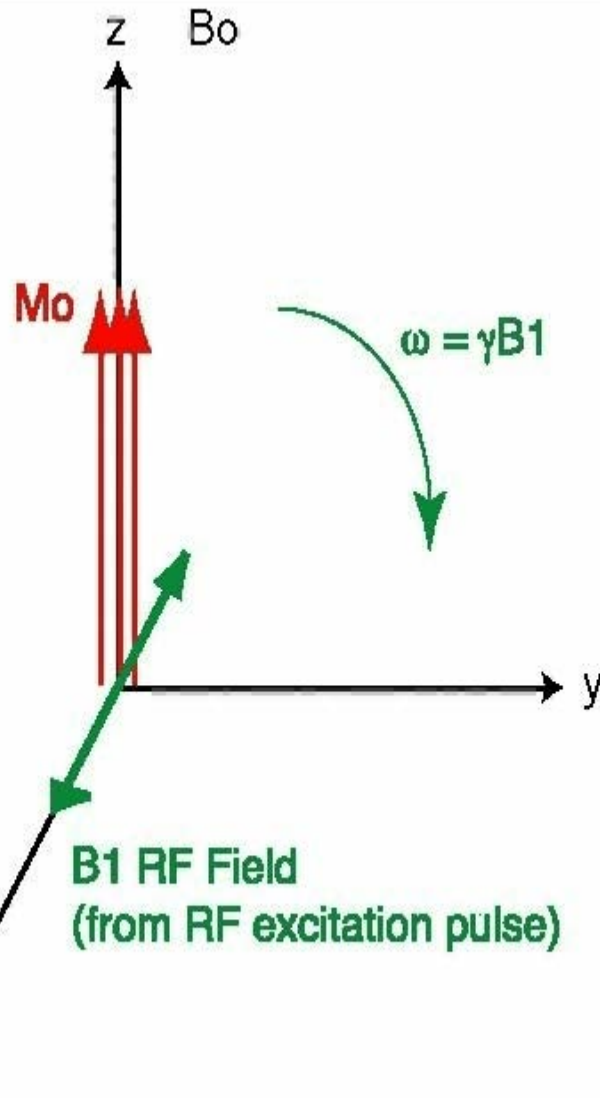

Why fast imaging

Capture time course,
(e.g. hemodynamic)
eliminate artifact from motion
(during encode.)

Magnetization vector durning MR

Review of Image encoding, journey through kspace

Two questions:

- 1) What does blipping on a gradient do to the water magnetization.
- 2) Why does measuring the signal amplitude after a blip tell you info about the spatial frequency composition of the image (k-space).

Aside: Magnetic field gradient

B_0

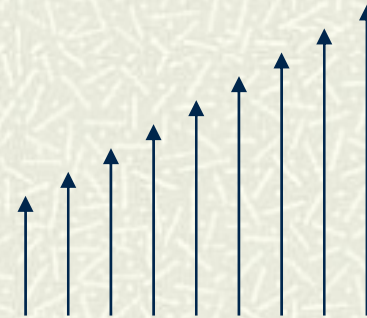

Uniform magnet

$G_x x$

**Field from
gradient
coils**

$B_0 + G_x x$

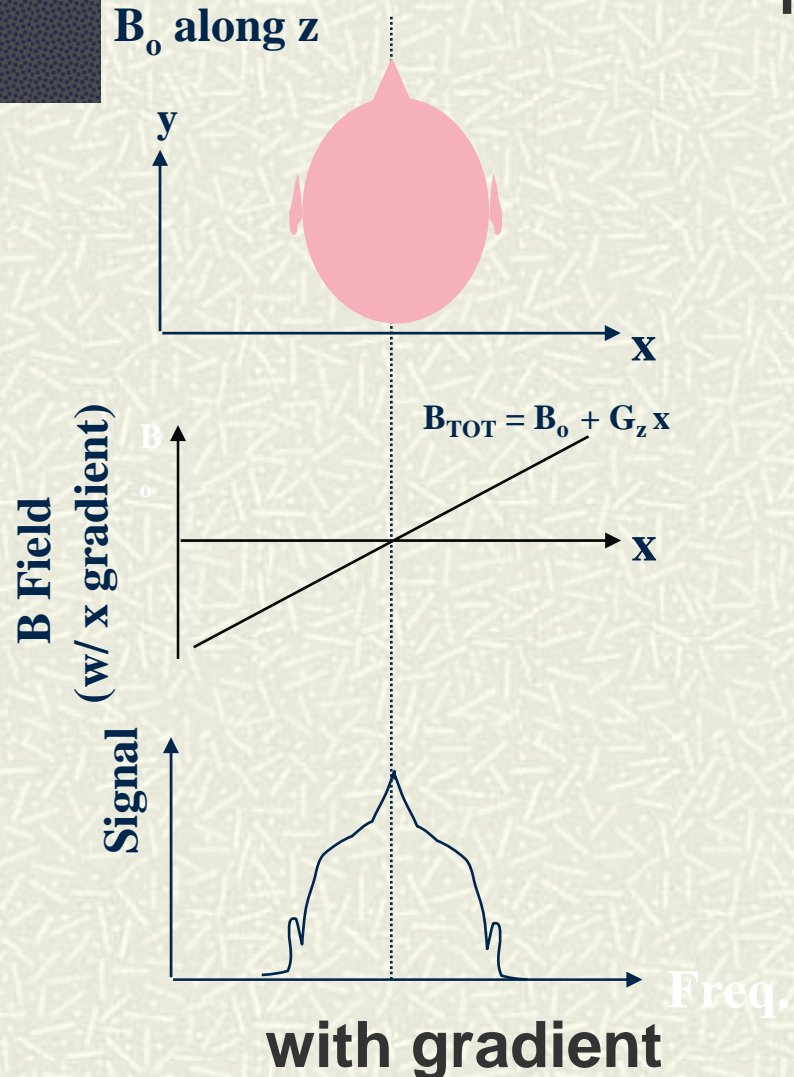

Total field

$$G_x = \partial B_z / \partial x$$

Step two: encode spatial info. in-plane

“Frequency encoding”

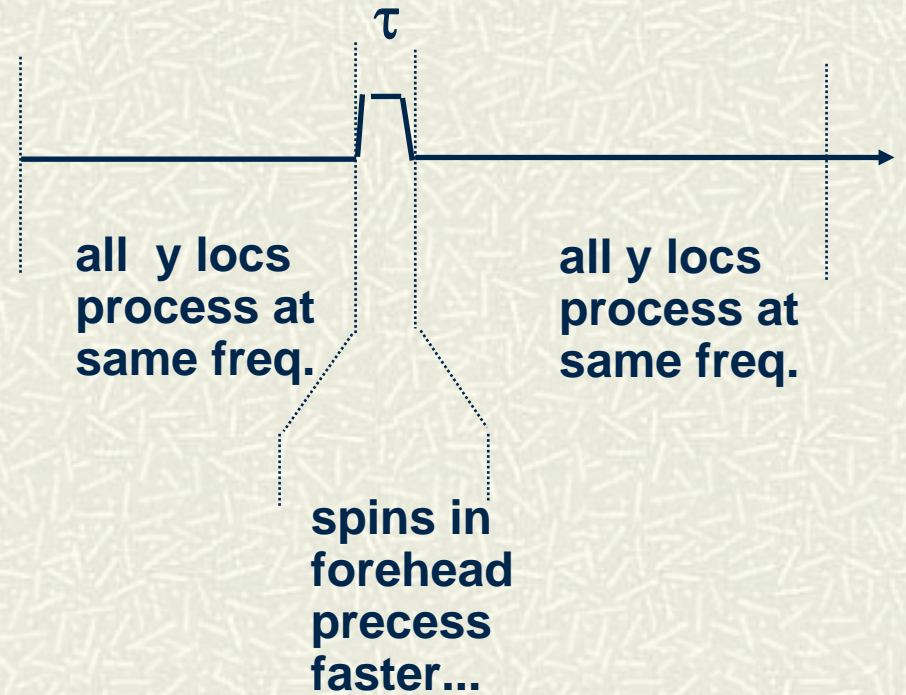

$$\nu = \gamma \mathbf{B}_{TOT} = \gamma (\mathbf{B}_0 + \mathbf{G}_x \mathbf{x})$$

How does blipping on a grad. encode spatial info?

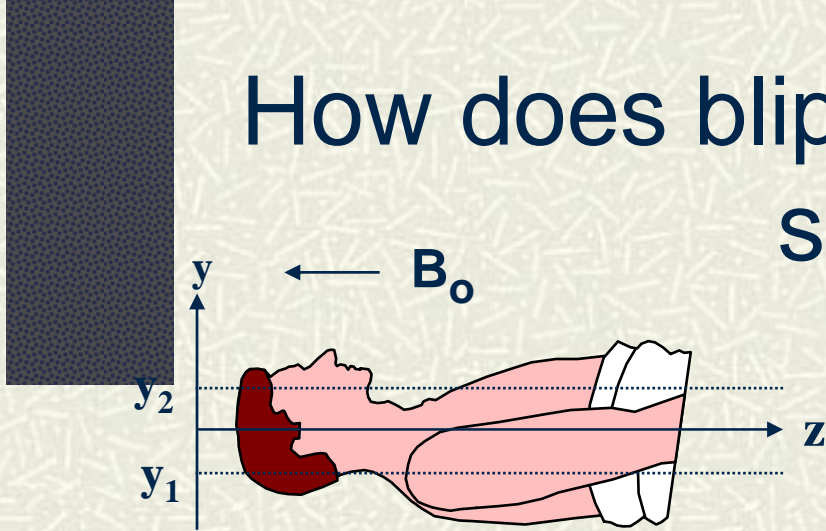

G_y

$$v(y) = \gamma \mathbf{B}_{TOT} = \gamma \mathbf{B}_o \Delta y \mathbf{G}_y$$

$$\theta(y) = v(y) \tau = \gamma \mathbf{B}_o \Delta y (\mathbf{G}_y \tau)$$

How does blipping on a grad. encode spatial info?

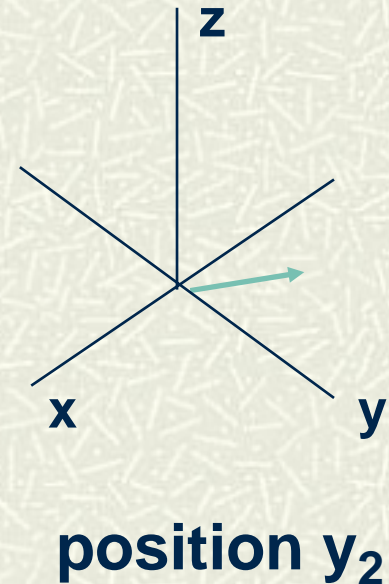

$$\theta(\mathbf{y}) = v(\mathbf{y}) \tau = \gamma \mathbf{B}_0 \Delta \mathbf{y} (\mathbf{G}_y \tau)$$

after RF

After the blipped y gradient...

How does blipping on a grad. encode spatial info?

The magnetization vector in the xy plane is wound into a helix directed along y axis.

Phases are 'locked in' once the blip is over.

The bigger the gradient blip area, the tighter the helix

$$\theta(\mathbf{y}) = v(\mathbf{y}) \tau = \gamma \mathbf{B}_o \Delta \mathbf{y} (\mathbf{G}_y \tau)$$

small blip 

medium blip 

large blip 

What have you measured?

Consider 2 samples:

no signal observed

signal is as big as if no gradient

Measurement intensity at a spatial frequency...

Fourier transform

Sample 3 points in kspace

Frequency and phase encoding are the same principle!

Conventional “Spin-warp” encoding

one excitation, one line of kspace...

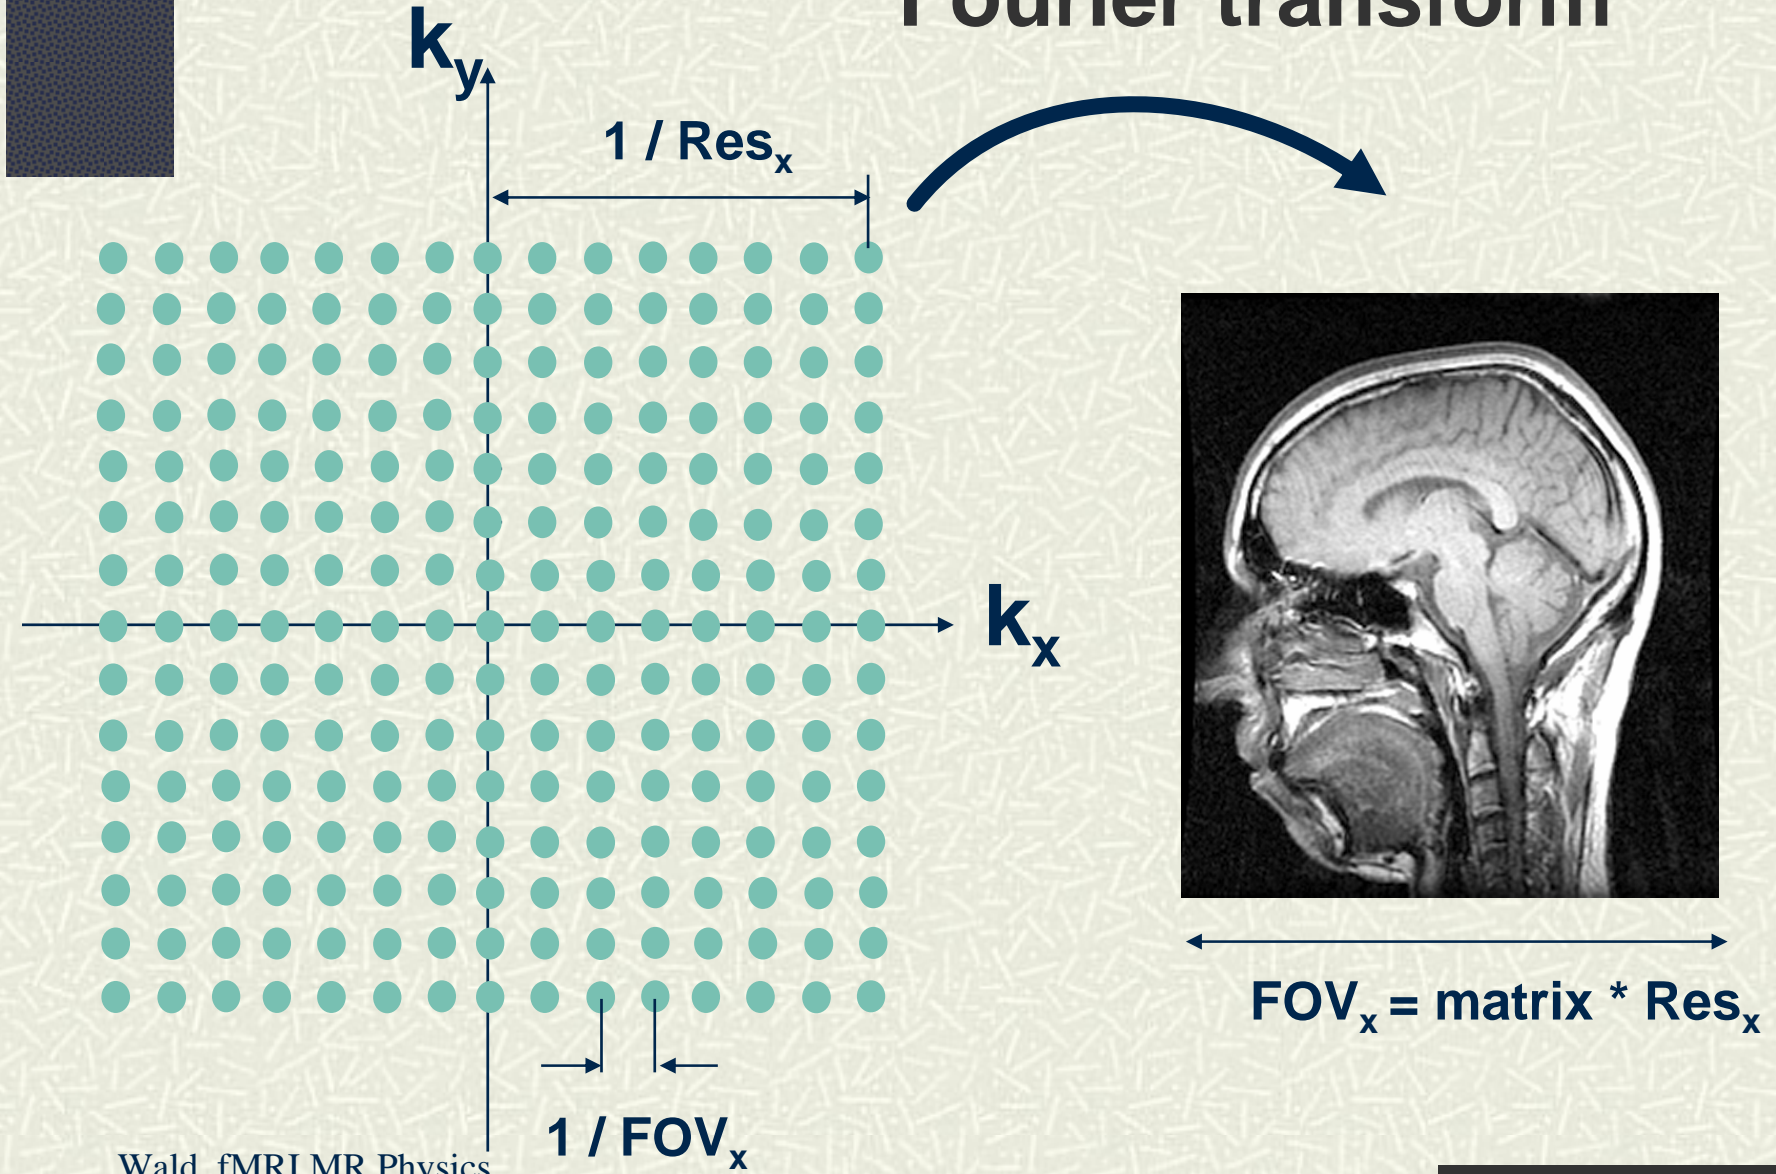

Image encoding,

*“Journey through
k-space”*

The Movie...

Fourier transform

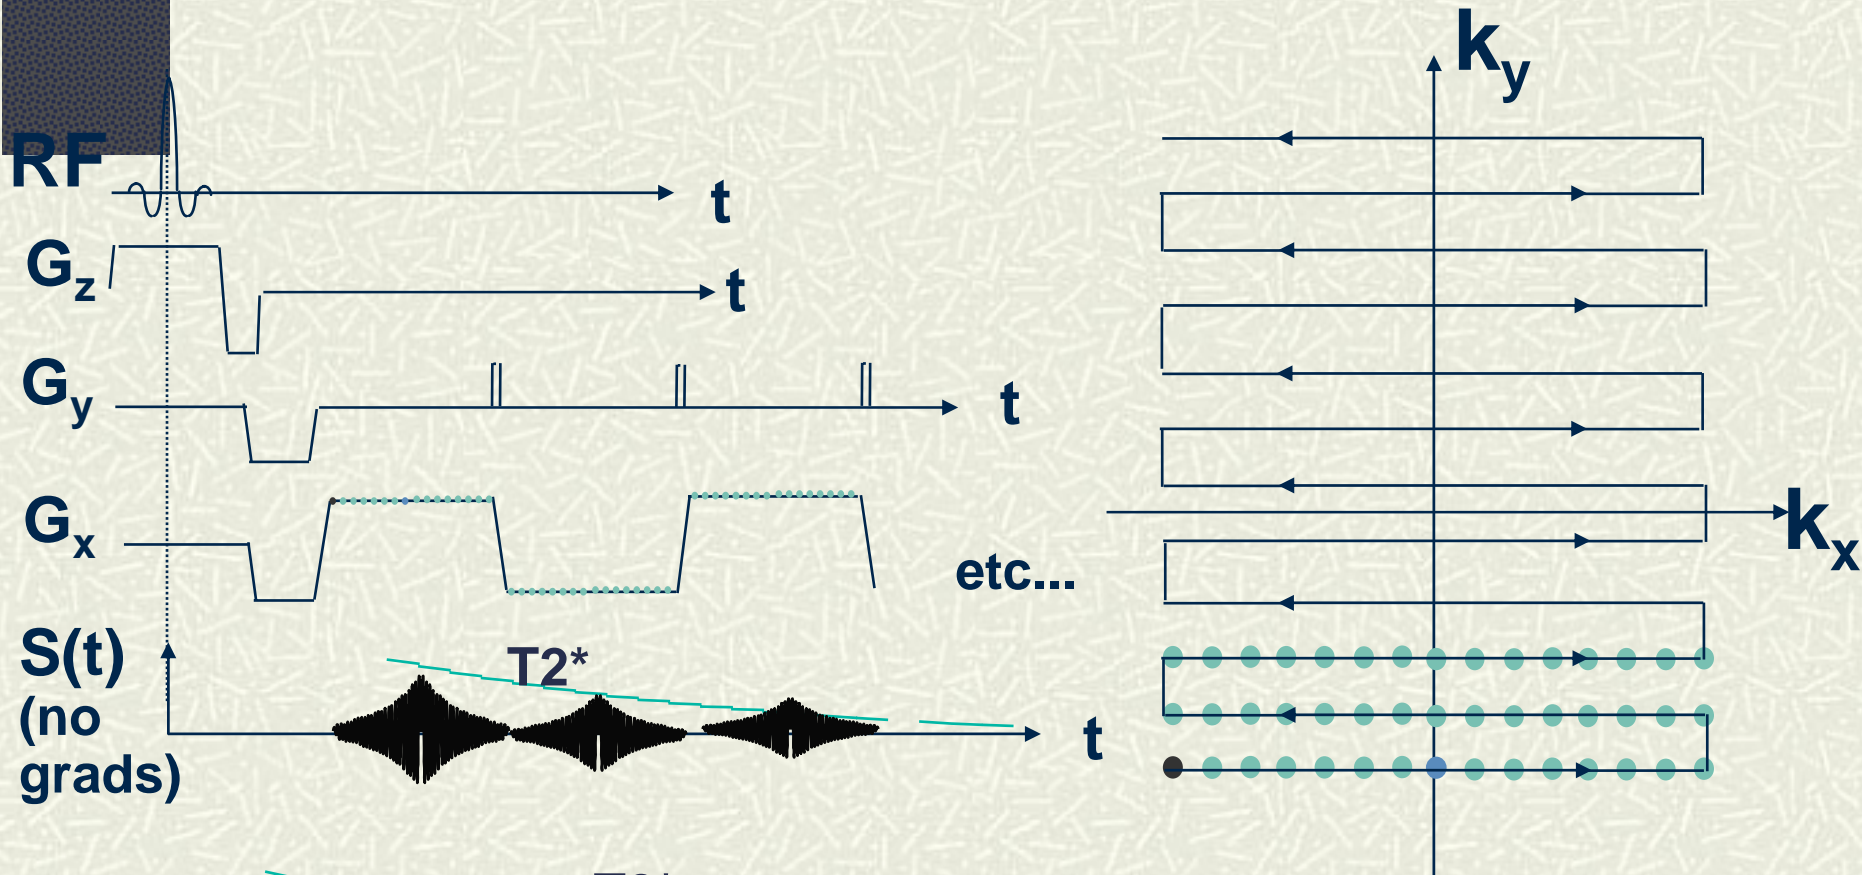

Conventional “Spin-warp” encoding

one excitation, one line of kspace...

“Echo-planar” encoding

one excitation, many lines of kspace...

Bandwidth is asymmetric in EPI

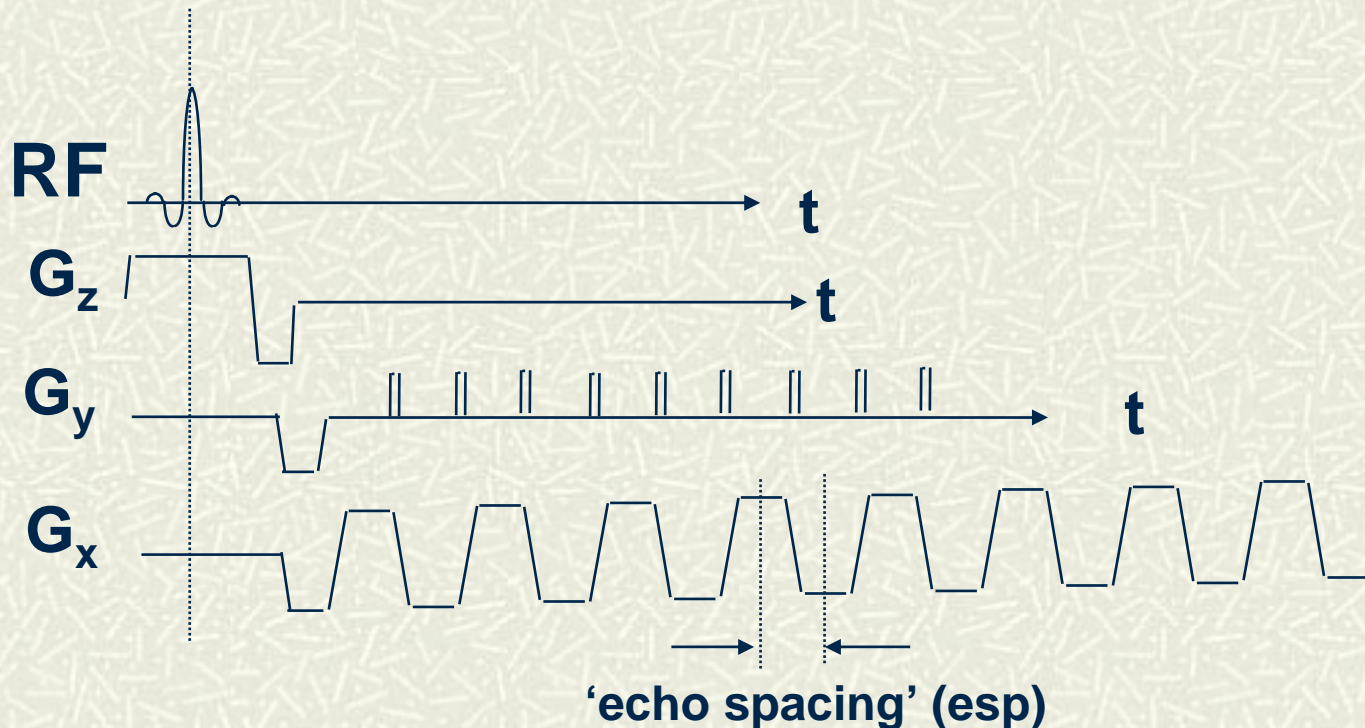

- Adjacent points in k_x have short $\Delta t = 5 \mu s$ (high bandwidth)
- Adjacent points along k_y are taken with long $\Delta t (= 500 \mu s)$. (low bandwidth)

The phase error (and thus distortions) are in the phase encode direction.

Characterization of EPI performance

length of readout train for given resolution
or echo spacing (esp) or freq of readout...

esp = 500 μ s for whole body grads, readout length = 32 ms
esp = 270 μ s for head gradients, readout length = 17 ms

What is important in EPI performance?

Short image encoding time.

Parameters related to total encoding time:

- 1) echo spacing.**
- 2) frequency of readout waveform.**

Key specs for achieving short encode times:

- 1) gradient slew rate.**
- 2) gradient strength.**
- 3) ability to ramp sample.**

Good shimming (second order shims)

Susceptibility in MR

The good.

The bad.

The ugly.

Enemy #1 of EPI: local susceptibility gradients

Orbitofrontal susceptibility region

Lateral temporal susceptibility region

B_0 field maps in the head

Enemy #1 of EPI: local susceptibility gradients

Orbitofrontal susceptibility region

Lateral temporal susceptibility region

B_0 field maps in the head

What do we mean by “susceptibility”?

In physics, it refers to a material’s tendency to magnetize when placed in an external field.

In MR, it refers to the effects of magnetized material on the image through its local distortion of the static magnetic field B_0 .

Ping-pong ball in water...

Susceptibility effects occur near magnetically dis-similar materials

Field disturbance around air surrounded by water (e.g. sinuses)

**Field map
(coronal image)
1.5T**

B_0 map in head: it's the air tissue interface...

Sagittal B_0 field maps at 3T

Susceptibility field (in Gauss) increases w/ B_0

**Ping-pong ball in H_2O :
Field maps ($\Delta TE = 5ms$), black lines
spaced by $0.024G$ ($0.8ppm$ at $3T$)**

1.5T

3T

7T

Other Sources of Susceptibility You Should Be Aware of...

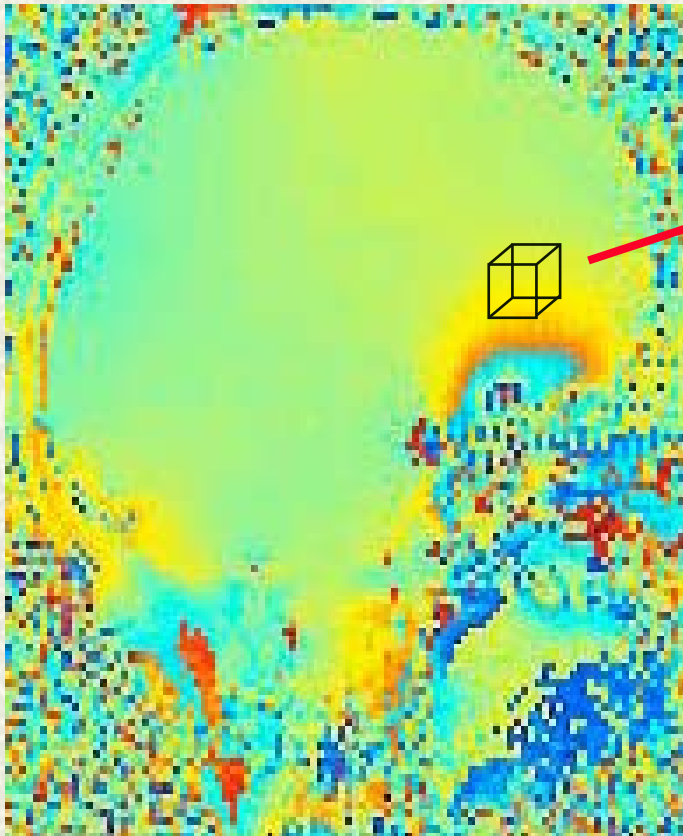

Those fillings might be a problem...

Local susceptibility gradients: 2 effects

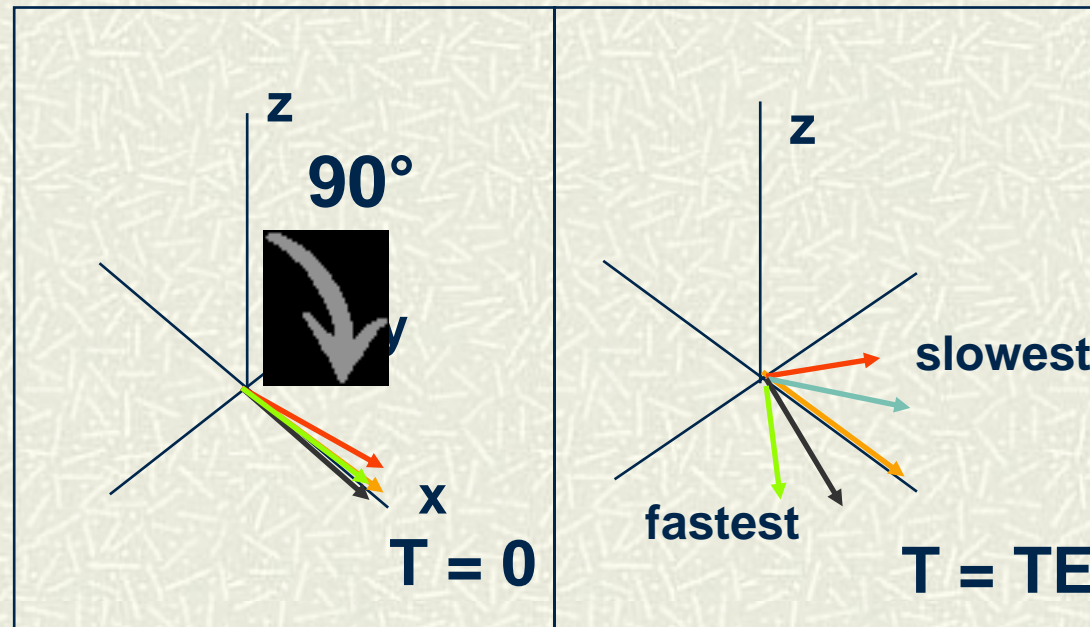

- 1) **Local dephasing of the signal (signal loss) within a voxel, mainly from thru-plane gradients**
- 2) **Local geometric distortions, (voxel location improperly reconstructed) mainly from local in-plane gradients.**

1) Non-uniform Local Field Causes Local Dephasing

Sagittal B_0 field map at 3T

5 water protons in different parts of the voxel...

Local susceptibility gradients: thru-plane dephasing in grad echo EPI

Bad for thick slice above frontal sinus...

Orbitofrontal susceptibility region

3T

Solution: high resolution

1mm isotropic
TE=30ms, GRAPPA =2
6/8 part-Fourier

Minimal OFC drop-out issues with 3T 1mm isotropic

3T 32ch EPI

Thru-plane dephasing gets worse at longer TE

Orbitofrontal susceptibility region

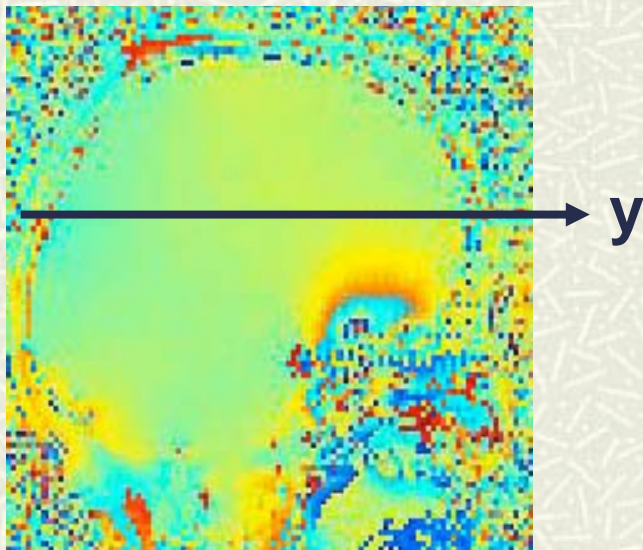

3T, TE = 21, 30, 40, 50, 60ms

Problem #2 Susceptibility Causes Image Distortion in EPI

Field near
sinus

To encode the image, we control phase evolution as a function of position with applied gradients.

Local suscept. Gradient causes unwanted phase evolution.

The phase encode error builds up with time. $\Delta\theta = \gamma \mathbf{B}_{\text{local}} \Delta t$

Susceptibility Causes Image Distortion

**Field near
sinus**

**Conventional grad. echo,
 $\Delta\theta \propto \text{encode time} \propto 1/\text{BW}$**

Susceptibility in EPI can give either a compression or expansion

Altering the direction kspace is transversed causes either local compression or expansion.

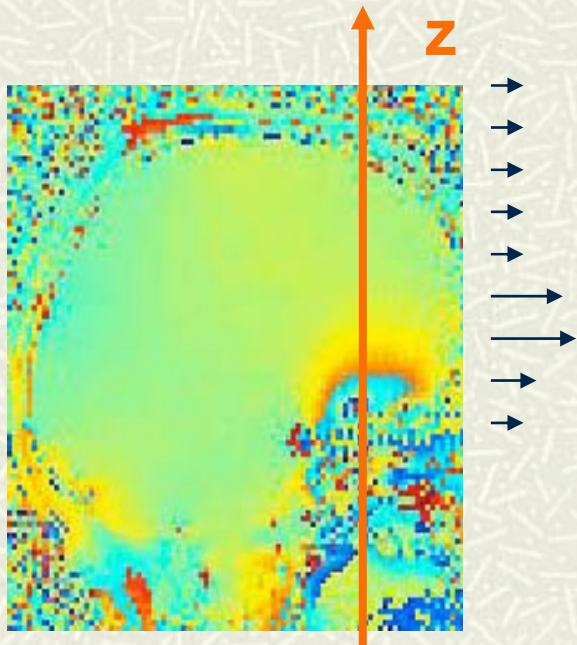

choose your poison...

3T whole body gradients

Susceptibility Causes Image Distortion

**Echoplanar Image,
 $\Delta\theta \propto \text{encode time} \propto 1/\text{BW}$**

**Field near
sinus**

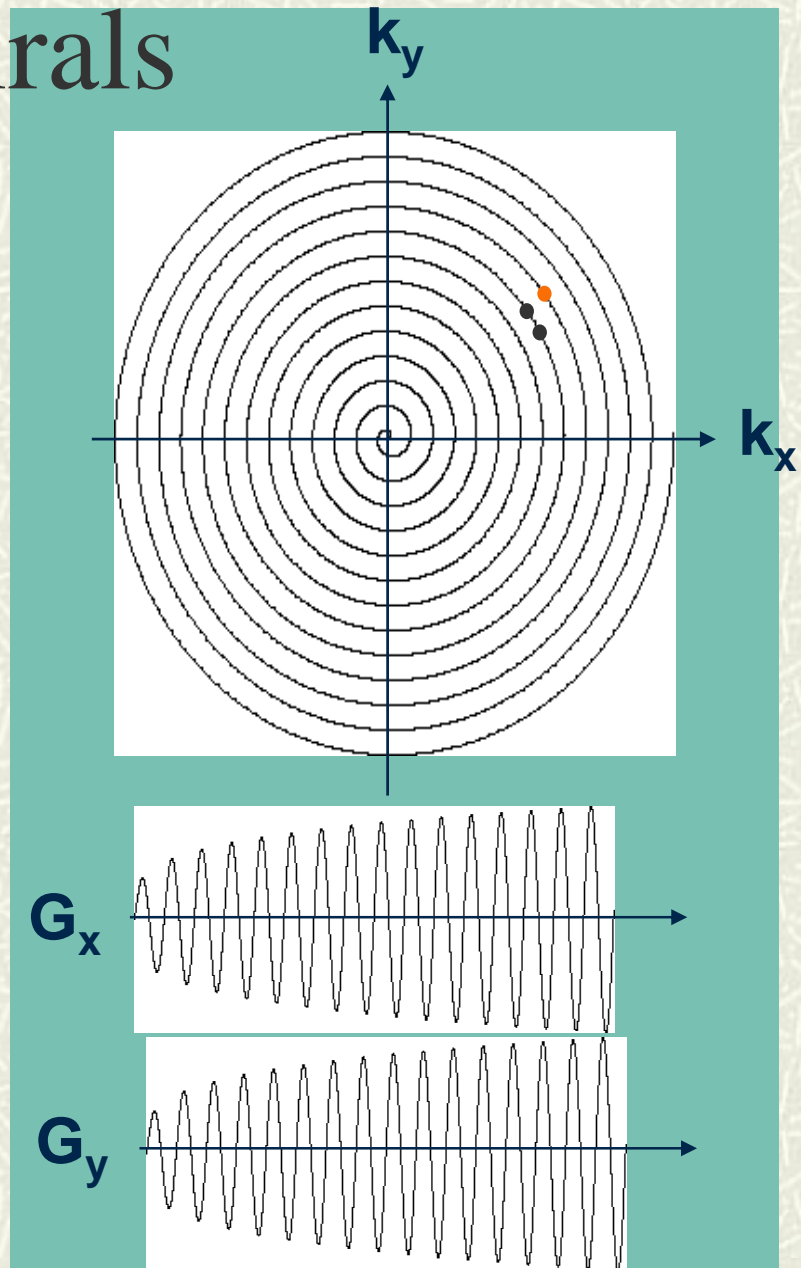

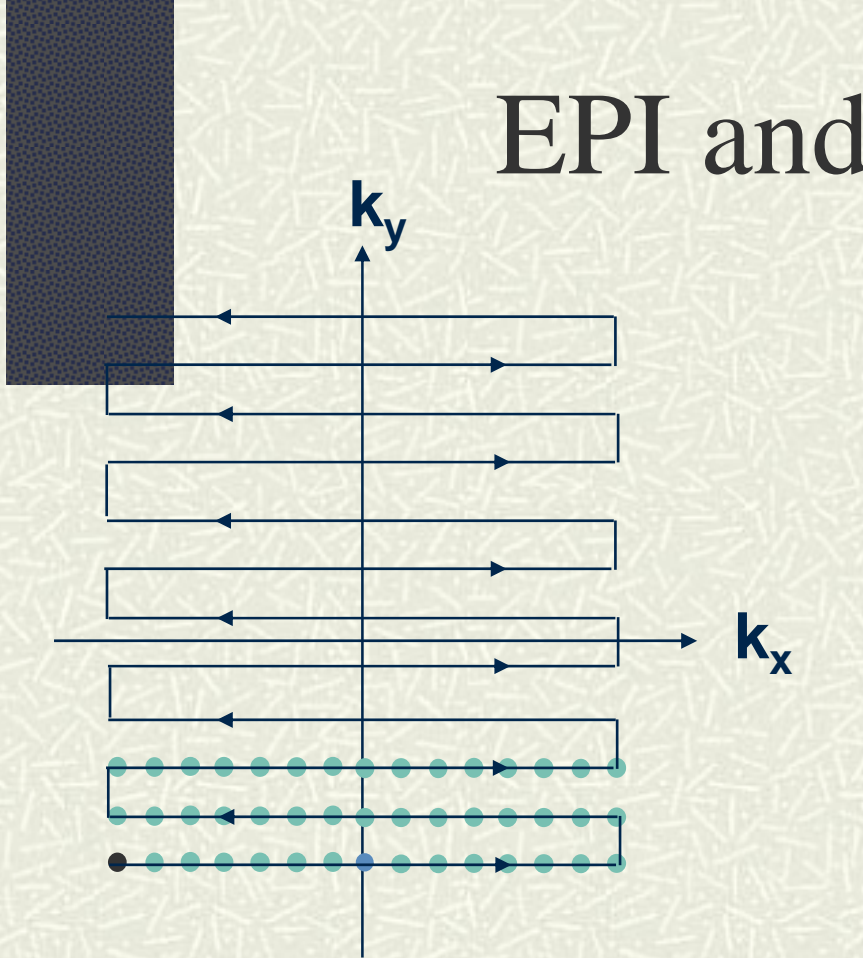

Wald, fMRI MR Physics

3T head gradients

Encode time = 34, 26, 22, 17ms

EPI and Spirals

EPI

Spirals

Susceptibility:

**distortion,
dephasing**

**blurring,
dephasing**

Eddy currents:

ghosts

blurring

$k = 0$ is sampled: 1/2 through 1st

Corners of kspace:

yes

no

Gradient demands:

very high

pretty high
