## 4 Bretschneider Spectrum Definition

The formula for the Bretschneider (one-sided) ocean wave spectrum is

$$
S(\omega)=\frac{5}{16} \frac{\omega_{m}^{4}}{\omega^{5}} H_{1 / 3}^{2} e^{-5 \omega_{m}^{4} / 4 \omega^{4}}
$$

where $\omega$ is frequency in radians per second, $\omega_{m}$ is the modal (most likely) frequency of any given wave, and $H_{1 / 3}$ is the significant wave height. Make a single figure that shows the Bretschneider spectrum ( $S$ as a function of $\omega$ ) for these cases:

| SeaState | $2 \pi / \omega_{m}$, sec | $H_{1 / 3}, \mathrm{~m}$ |
| :---: | :---: | :---: |
| 2 | 6.3 | 0.3 |
| 3 | 7.5 | 0.9 |
| 4 | 8.8 | 1.9 |
| 5 | 9.7 | 3.3 |
| 6 | 12.4 | 5.0 |

Here is the MATLAB code I used and the resulting figure:
